## Mixtures of Acids and Bases

## PURPOSE

To investigate the resulting pH 's of different mixtures of acid and base solutions.

## GOALS

1 To calculate the pH of pure acid and base solutions.
2 To calculate the pH of mixtures of acid and base solutions.
3 To measure the pH of pure acid and base solutions and mixtures of these solutions.
4 To compare the resulting pH 's of different mixtures of acid and base solutions.

## INTRODUCTION

Brønsted acids are defined as proton donors. When placed in water, Brønsted acids (HA) donate a proton to water to produce the conjugate base of the acid $\left(\mathrm{A}^{-}\right)$and a hydronium ion $\left(\mathrm{H}_{3} \mathrm{O}^{+}\right)$ according to the following reaction.

$$
\begin{equation*}
\mathrm{HA}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{~A}^{-}+\mathrm{H}_{3} \mathrm{O}^{+} \tag{1}
\end{equation*}
$$

This is defined as the acid dissociation reaction and the equilibrium constant for this reaction is called the acid dissociation constant, $\mathrm{K}_{a}{ }^{1} . \mathrm{K}_{a}$ values for several acids can be found in the Tables of Physical Data ${ }^{2}$ and in an appendix in your CH 201 Chemistry: A Quantitative Science textbook. The larger the $\mathrm{K}_{a}$ value is for an acid, the stronger the acid. The Brønsted acids are divided into two main groups: strong acids and weak acids.

## : Strong Acids:

The $\mathrm{K}_{a}$ 's for strong acids, such as HCl and $\mathrm{HNO}_{3}$, are simply listed as $\gg 1$ which indicates that they dissociate $100 \%$ when placed in water.

$$
\begin{equation*}
\mathrm{HCl}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{Cl}^{-}+\mathrm{H}_{3} \mathrm{O}^{+} \tag{2}
\end{equation*}
$$

Since strong acids dissociate completely, the $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=$[strong acid concentration] and $\mathrm{pH}=$ $-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$.

## : Weak Acids:

Weak acids, such as $\mathrm{NH}_{4}^{+}$and $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$, only partially dissociate in water according to their $\mathrm{K}_{a}$ 's. As with any equilibrium reaction, the equilibrium concentrations can be calculated by generating a reaction table and substituting into the $\mathrm{K}_{a}$ expression. For example, acetic acid, $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$,

[^0]has a $\mathrm{K}_{a}$ of $1.8 \times 10^{-5}$. So for a 0.2 M aqueous solution of $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$, the equilibrium concentrations can be calculated as follows.

Thus, the equilibrium concentrations are $\left[\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}\right]=0.2 \mathrm{M}$ and $\left[\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}^{-}\right]=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=1.9 \mathrm{x}$ $10^{-3} \mathrm{M}$.

Equation 3 shows the detailed method to calculate $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$for a weak acid. In cases where the percent ionization of the acid - or the equilibrium concentration of conjugate base [A-] divided by the initial concentration of the weak acid [WA] as a percentage out of 100 -is less than $5 \%$, equation 3 simplifies to the expression below, where $c_{w a}$ represents the original concentration of the weak acid in M .

$$
\begin{equation*}
\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\left(\mathrm{K}_{a} \times \mathrm{c}_{\mathrm{wa}}\right)^{1 / 2}=\left(1.8 \times 10^{-5} \times 0.2\right)^{1 / 2}=1.9 \times 10^{-3} \mathrm{M} \tag{4}
\end{equation*}
$$

The pH of this solution can now be calculated by taking the $-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$to get 2.72.
Similarly, Brønsted bases ( $\mathrm{B}^{-}$) are defined as proton acceptors and when placed in water will accept a proton from water to produce the base's conjugate acid $(\mathrm{HB})$ and a hydroxide ion $\left(\mathrm{OH}^{-}\right)$.

$$
\begin{equation*}
\mathrm{B}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{HB}+\mathrm{OH}^{-} \tag{5}
\end{equation*}
$$

This reaction is defined as the base association reaction and the equilibrium constant for it is the base association constant, $\mathbf{K}_{b}$. $\mathrm{K}_{b}$ 's cannot be found in tables as $\mathrm{K}_{a}$ 's are. $\mathrm{K}_{b}$ 's must be calculated according to the following equation at $25^{\circ} \mathrm{C}$.

$$
\begin{equation*}
\mathrm{K}_{a} \times \mathrm{K}_{b}=\mathrm{K}_{w}=1.0 \times 10^{-14} \tag{6}
\end{equation*}
$$

The Brønsted bases are also divided up into two main groups: strong bases and weak bases.

## : Strong Bases:

The most common strong bases found in the laboratory are the Group IA salts of hydroxide, which completely dissociate in water to give one equivalent of $\mathrm{OH}^{-}$.

$$
\begin{equation*}
\mathrm{NaOH}(s) \rightarrow \mathrm{Na}^{+}(a q)+\mathrm{OH}^{-}(a q) \tag{7}
\end{equation*}
$$

Since the salts dissociate completely, the $\left[\mathrm{OH}^{-}\right]=[$strong base concentration $]$and the $\mathrm{pOH}=-$ $\log \left[\mathrm{OH}^{-}\right]$. At 298 K , the relationship between pH and pOH is:

$$
\begin{equation*}
\mathrm{pH}=14-\mathrm{pOH} \tag{8}
\end{equation*}
$$

## : Weak Bases:

Sodium acetate, $\mathrm{NaC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$, is considered a weak base. Using equation 6 above, the $\mathrm{K}_{b}$ for $\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}{ }^{-}$is $\left(1.0 \times 10^{-14}\right) /\left(1.8 \times 10^{-5}\right)=5.6 \times 10^{-10}$. Using this value and a reaction table, the equilibrium composition of a $0.2 \mathrm{M} \mathrm{NaC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$ solution can be calculated as follows.

Thus the equilibrium concentrations are $\left[\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}{ }^{-}\right]=0.2 \mathrm{M}$ and $\left[\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}\right]=\left[\mathrm{OH}^{-}\right]=1.1 \mathrm{x}$ $10^{-5} \mathrm{M}$.

Equation 9 shows the detailed method to calculate $\left[\mathrm{OH}^{-}\right]$for a weak base. In cases where the percent ionization of the base or the equilibrium concentration of the conjugate acid [HB] divided by the initial concentration of the weak base $\left[\mathrm{B}^{-}\right]$as a percentage out of 100 -is less than $5 \%$, equation 9 simplifies to the expression below, where $\mathrm{c}_{w b}$ represents the original concentration of the weak base in M .

$$
\begin{equation*}
\left[\mathrm{OH}^{-}\right]=\left(\mathrm{K}_{b} \times \mathrm{c}_{\mathrm{wb}}\right)^{1 / 2}=\left(5.6 \times 10^{-10} \times 0.2\right)^{1 / 2}=1.1 \times 10^{-5} \mathrm{M} \tag{10}
\end{equation*}
$$

The pOH of this solution can now be calculated by taking the $-\log \left[\mathrm{OH}^{-}\right]$to get 4.98. Using equation 8 , the pH of the $0.2 \mathrm{M} \mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}^{-}$solution is $14-4.98=9.02$.

When acids and bases are mixed together, things become more complicated. No matter how complicated, all mixtures of acids and bases should be approached the same way.

1 Determine what species actually exist in solution. Any sodium or potassium salt will dissociate completely as will any strong acid or base.

2 Write out a balanced chemical reaction to describe any interactions that will occur. Remember that the reactants must be present in the original solution as identified in step 1.

Look for possible $\mathrm{K}_{a}$ or $\mathrm{K}_{b}$ reactions. Or for reactions of a weak base with a hydronium ion or a weak acid with a hydroxide ion that will react $100 \%$. Sometimes there will not be an appropriate chemical reaction!

3 Generate a reaction table based on the balanced chemical reaction. Remember that the initial concentrations for the products are not necessarily zero!

4 Calculate the equilibrium composition of the mixture. This is only possible if the equilibrium constant for the reaction is known or if the reaction goes to completion.

5 Calculate the $\mathbf{p H}$. Once the $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$or $\left[\mathrm{OH}^{-}\right]$is known, the pH can be calculated as above in the pure solutions.

Figure 1 demonstrates the potential combinations that can occur when mixing acids and bases.

Figure 1: Combinations of Acids and Bases

## : Mixture 1:

Mixture 1, reaction of a strong acid and strong base, goes to completion. A reaction table can be used to determine if excess acid or base remains. For example, consider the addition of $10 . \mathrm{mL}$ of 0.10 M HCl to 15 mL of 0.20 M NaOH . Since two solutions are being mixed, it is better to use moles or mmoles in your reaction table.

|  | $\mathrm{H}_{3} \mathrm{O}^{+}$ | $\mathrm{OH}^{-}$ | $\rightarrow \mathrm{H}_{2}$ | $+\mathrm{H}_{2} \mathrm{O}$ |
| :---: | :---: | :---: | :---: | :---: |
| given | 10. mL x 0.10 M | $15 \mathrm{~mL} \times 0.20 \mathrm{M}$ |  |  |
| initial | 1.0 mmol | 3.0 mmol | - | - |
| $\Delta$ | $-1.0 \mathrm{mmol}$ | $-1.0 \mathrm{mmol}$ | - | - |
| final | 0 mmol | 2.0 mmol | - | - |

In this example, only strong base remains. The $\left[\mathrm{OH}^{-}\right]$can be calculated from the final mmol/(total volume) to give $2.0 \mathrm{mmol} /(10+15 \mathrm{~mL})=0.08 \mathrm{M}$. Table $6-1$ contains the necessary formulas to calculate pOH and pH from this information. The pH of this mixture is 12.90 .

Table 6-1. pH Formula Summary

| Remaining Species | Formulas |
| :---: | :---: |
| Strong Acid | $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=[\mathrm{SA}] \quad \mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$ |
| Weak Acid | $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\left(\mathrm{K}_{\mathrm{a}} \times \mathrm{C}_{\mathrm{wa}}\right)^{1 / 2} \quad \mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$ |
| Strong Base | $\left[\mathrm{OH}^{-}\right]=[\mathrm{SB}] \quad \mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right] \quad \mathrm{pH}=14-\mathrm{pOH}$ |
| Weak Base | $\mathrm{K}_{\mathrm{b}}=\mathrm{K}_{\mathrm{w}} / \mathrm{K}_{\mathrm{a}} \quad\left[\mathrm{OH}^{-}\right]=\left(\mathrm{K}_{\mathrm{b}} \times \mathrm{c}_{\mathrm{wb}}\right)^{1 / 2} \quad \mathrm{pOH}=-\log \left[\mathrm{OH}^{-}\right] \quad \mathrm{pH}=14-\mathrm{pOH}$ |
| Weak Acid \& Weak Base | $\mathrm{pH}=\mathrm{pKa}+\log (\mathrm{mmol}$ base $/ \mathrm{mmol}$ acid $)$ |

## : Mixture 2:

Mixture 2, reaction of a strong base and weak acid, also goes to completion. Depending upon the relative amounts of material, the final solution may be composed of only strong base, only weak base, or a mixture of weak acid and weak base. For example, consider the addition of $15 . \mathrm{mL}$ of 0.20 M NaOH to $10 . \mathrm{mL}$ of $0.30 \mathrm{M} \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$. Since two solutions are being mixed, it is better to use moles or mmoles in your reaction table.

|  | $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$ | + | $\mathrm{OH}^{-}$ | $\rightarrow$ |
| :--- | ---: | ---: | :---: | :---: | $\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}^{-} \quad+\mathrm{H}_{2} \mathrm{O}$

In this example, only weak base remains. The $\left[\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}^{-}\right]$can be calculated from the final $\mathrm{mmol} /($ total volume $)$ to give $3.0 \mathrm{mmol} /(10+15 \mathrm{~mL})=0.120 \mathrm{M}$. Table $6-1$ contains the necessary formulas to calculate the pH , given the concentration of weak base. The pH of this mixture is 8.91 .

## : Mixture 3:

Mixture 3, a strong base and weak base, does not have any reaction. Rather, the [ $\mathrm{OH}^{-}$] associated with the strong base tends to suppress generation of $\left[\mathrm{OH}^{-}\right]$from the reaction of the weak base and water. Please consult your CH 201 textbook for more details. In compositions such as this, the pH can be readily obtained by focusing upon the concentration of strong base. For example, consider the addition of $20 . \mathrm{mL}$ of 0.20 M NaOH to $10 . \mathrm{mL}$ of $0.20 \mathrm{M} \mathrm{NaC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$. This results in dilution of the strong base. In this example, $\left[\mathrm{OH}^{-}\right]=\mathrm{mmol} \mathrm{NaOH} /$ total volume $=20 \mathrm{~mL} \times 0.20$ $\mathrm{M} \mathrm{OH}^{-} /(20 .+10 . \mathrm{mL})=0.13 \mathrm{M}$. Table $6-1$ contains the necessary formulas to calculate pOH and pH from this information. The pH of this mixture is 13.12.

## : Mixture 4:

Mixture 4, reaction of a strong acid and weak base, also goes to completion. Depending upon
the relative amounts of material, the final solution may be composed of only strong acid, only weak acid, or a mixture of weak acid and weak base. For example, consider the addition of $15 . \mathrm{mL}$ of 0.20 M HCl to $20 . \mathrm{mL}$ of $0.20 \mathrm{M} \mathrm{NaC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$. Since two solutions are being mixed, it is better to use moles or mmoles in your reaction table.

|  | $\mathrm{H}_{3} \mathrm{O}^{+}$ | + | $\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}^{-}$ |
| :--- | ---: | ---: | :---: | :---: | :---: |$\rightarrow \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}+\mathrm{H}_{2} \mathrm{O}$

In this example, weak acid and weak base remain. This type of solution is known as a buffer and will be explored in greater detail in experiment 7. The pH can be calculated using the HendersonHasselbalch equation:

$$
\begin{equation*}
\mathrm{pH}=\mathrm{pK}_{a}+\log \left(\frac{[\text { base }]}{[\text { acid }]}\right) \text { or } \mathrm{pH}=\mathrm{pK}_{a}+\log \left(\frac{\text { moles of base }}{\text { moles of acid }}\right) \tag{11}
\end{equation*}
$$

For the current example,

$$
\mathrm{pH}=-\log \left(1.8 \times 10^{-5}\right)+\log \left(1.0 \mathrm{mmol} \mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}^{-} / 3.0 \mathrm{mmol} \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}\right)=4.26
$$

## : Mixture 5:

Mixture 5, a strong acid and weak acid, also does not have any reaction. The $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$associated with the strong acid tends to suppress generation of $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$from the reaction of the weak acid and water. In compositions such as this, the pH can be readily obtained by focusing upon the concentration of strong acid. For example, consider the addition of $30 . \mathrm{mL}$ of 0.20 M HCl to 20 . mL of $0.15 \mathrm{M} \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$. This results in dilution of the strong acid. In this example, $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=$ $\mathrm{mmol} \mathrm{HCl} /$ total volume $=30 \mathrm{~mL} \times 0.20 \mathrm{M} \mathrm{H}_{3} \mathrm{O}^{+} /(30 .+20 . \mathrm{mL})=0.12 \mathrm{M}$. The $\mathrm{pH}=-\log$ $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=0.92$.

## : Mixture 6:

Mixture 6, the combination of a weak acid and a weak base, is also a buffer. The pH can be calculated using the Henderson-Hasselbalch equation. For example, consider the mixture of 10. mL of $0.1 \mathrm{M} \mathrm{NH}_{4} \mathrm{Cl}$ and 15 mL of $0.10 \mathrm{M} \mathrm{NH}_{3}$. For this example,

$$
\mathrm{pH}=-\log \left(5.6 \times 10^{-10}\right)+\log \left(1.5 \mathrm{mmol} \mathrm{NH} 33 / 1.0 \mathrm{mmol} \mathrm{NH}_{4}^{+}\right)=9.43
$$

This is a brief summary of calculating the pH of pure acid and base solutions as well as mixtures of acid and base solutions. In this lab, you will explore these solutions in more detail and gain a greater understanding of equilibrium in aqueous acid/base mixtures.

## EQUIPMENT

$125 \times 150 \mathrm{~mm}$ test tube
1400 mL beaker (to hold the test tube)

1 glass stir rod
110 mL graduated cylinder
1100 mL beaker
230 mL beakers
1 MicroLab Interface
1 MicroLab pH Measurement Instruction Sheet
1 pH electrode in pH 7.00 buffer
1 ring stand
1 clamp
1250 mL beaker for electrode rinsings
1 deionized water squirt bottle
1 box Kimwipes

## REAGENTS

$\sim \mathbf{6 0} \mathbf{~ m L} \quad 0.1 \mathrm{M} \mathrm{NaOH}$
$10 \mathrm{~mL} \quad 0.1 \mathrm{M} \mathrm{HCl}$
$10 \mathrm{~mL} \quad 0.1 \mathrm{M} \mathrm{NH}_{4} \mathrm{Cl}$
$10 \mathrm{~mL} \quad 0.1 \mathrm{M} \mathrm{NaC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$
~ $\mathbf{1 5} \mathbf{~ m L} \quad \mathrm{pH} 4.00$ buffer
~ $\mathbf{1 5} \mathbf{~ m L} \quad \mathrm{pH} 7.00$ buffer
$\sim \mathbf{1 5} \mathbf{~ m L} \quad \mathrm{pH} 10.00$ buffer

## SAFETY

HCl and NaOH are corrosive. They can attack the skin and cause permanent damage to the eyes. If either solution splashes into your eyes, use the eyewash immediately. Hold your eyes open and flush with water for at least 15 minutes. If contact with skin or clothing occurs, immediately rinse the affected area with water for at least 15 minutes. Have your lab partner notify your teaching assistant about the spill.

The chemicals used in this experiment are very dilute so gloves will not be available. Remember to wash your hands with soap and water when the experiment is completed.

## WASTE DISPOSAL

All solutions can be disposed of down the sink drain followed by flushing with plenty of water.

## PRIOR TO CLASS

Please complete your WebAssign prelab assignment. Check your WebAssign account for due dates. Students who do not complete the WebAssign prelab are required to bring and hand in the prelab worksheet.

Please enter the calculated pH values from the WebAssign pre-lab assignment in Data Table A on your printed worksheet.

## LAB PROCEDURE

Please print the worksheet for this lab. You will need this sheet to record your data.
In this experiment, you will be using pH electrodes connected to the MicroLab Interface. pH electrodes have a thin glass bulb at the tip. They break easily and are costly to replace. Be careful not to shove the electrode into the bottom of a beaker or drop the electrode. There is a protective guard around the tip, which should remain in place at all times. The guard will not protect against careless treatment. Please use extreme care when using this equipment.

Best results in using the electrodes are obtained if:

- Electrodes are kept in standard pH 7 buffer solution when not in use.
- Immediately prior to use, the electrodes are rinsed with deionized water and gently blotted with a Kimwipe, then placed in the test solution.
- The electrodes are rinsed and blotted again after the measurement and returned to the pH 7 buffer solution.

## Part A: Calibrating the MicroLab ${ }^{\text {TM }}$ pH Electrode

1 Open the MicroLab program.
2 Make sure the pH electrode is plugged into the interface.
3 Calibrate the pH electrode using the MicroLab instructions provided in the lab.
4 Configure the MicroLab program to collect data as described in the lab.
5 After the calibration and configuration are complete, measure the pH of each of the three buffer solutions of $\mathrm{pH}=4.00$ (red), $\mathrm{pH}=7.00$ (yellow), and $\mathrm{pH}=10.00$ (blue). Record the value in the digital display in WebAssign as a record of how accurately the probe is calibrated. Make sure the electrode is immersed in the solution and allow for a few seconds of equilibration.

## Part B: Measuring the pH of Acid/Base Mixtures

1 In a 100 mL beaker, obtain $\sim 70 \mathrm{~mL}$ of 0.1 M NaOH from the side shelf.
2 Measure 10.0 mL of deionized water using the 10 mL graduated cylinder. Carefully pour the water into the $25 \times 150 \mathrm{~mm}$ test tube and place it in the 400 mL beaker for support.

3 Measure the pH of the deionized water and record it in Data Table A.
a Remove the electrode from the buffer, rinse the electrode with deionized water and blot it with a Kimwipe.
b During measurement, place the electrode such that it is immersed in the sample solution and swirl the beaker gently, allowing a few seconds for equilibration.
c After the measurement is recorded, rinse the electrode with deionized water and blot it with a Kimwipe. Then return it to the pH 7 buffer provided.

4 Measure 5.0 mL of 0.1 M NaOH using the graduated cylinder. Carefully add the NaOH to the water in the test tube. Use the glass stir rod to gently mix the solution.

5 Measure the pH of the deionized water plus 5.0 mL of NaOH and record it in Data Table A.
6 Again measure 5.0 mL of 0.1 M NaOH using the graduated cylinder and carefully add it to the solution in the test tube. Use the glass stir rod to gently mix the solution.

7 Measure the pH of the deionized water plus 10.0 mL of NaOH and record it in Data Table A.
8 One more time measure 5.0 mL of 0.1 M NaOH using the graduated cylinder and carefully add it to the solution in the test tube. Use the glass stir rod to gently mix the solution.

9 Measure the pH of the deionized water plus 15.0 mL of NaOH and record it in Data Table A.
10 Pour your solution down the sink and flush with tap water. Rinse out the test tube with deionized water and dry as best as you can.

11 Repeat steps 2-10 substituting 0.1 M HCl for the deionized water.
12 Repeat steps 2-10 substituting 0.1 M NH 4 Cl for the deionized water.
13 Repeat steps 2-10 substituting $0.1 \mathrm{M} \mathrm{NaC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$ for the deionized water.
14 After your last measurement, stop and close the MicroLab software. Rinse all of your glassware with water, dry it and return it to the set-up area where you found it. Make sure the pH electrode is submerged in the pH 7 buffer solution.

15 Before leaving, enter your results in the InLab assignment. If all results are scored as correct, log out. If not all results are correct, try to find the error or consult with your teaching assistant. When all results are correct, note them and log out of WebAssign. The InLab assignment must be completed by the end of the lab period. If additional time is needed, please consult with your teaching assistant.
